Description

BAM! is a sofa reduced to its basic geometry with two block-shaped volumes creating a seat and back. The design has clear influences from Pop Art culture, and as the name suggests, the sofa leaves the spectator with a sudden and distinct first impression.

The legs come upholstered in the same textile as the seat and back. Both its design and supporting function draw their inspiration from Gothic buttresses.

The included cushions are filled with recycled goose and duck feathers from old down products. One of the cushions has been designed with details of a black large embroidered patch with the text BAM!, a nod to the American artist Roy Lichtenstein.

BAM! is delivered disassembled in flat packages, for a climate-smart transport. The flat packages are also easy to transport and assemble, where a few components are connected with a smart wedge fitting.

Instructions for Fabric

Regular gentle vacuum cleaning helps to preserve the fabric's attractive colour and appearance. Wool is naturally resistant to dirt and fire. It is antistatic and attracts dirt to a lesser degree than other fabrics do. Dry wet spots with a piece of white kitchen roll. Scrape up dry, attached spots with a spoon. Most spots can be removed with lukewarm water possibly added a neutral detergent. It is a good idea to do a test where it will not show before applying a cleaning agent. Use only small quantities of cleaning agent at a time and dry up with absorbent paper as you work. If the spot does not disappear using water and a neutral detergent, follow the instructions in our guide to spots available on the website.

Should the need for disinfection arise, this can be done by washing at minimum 74°C or by wiping with ethanol. NOTE: This applies to Comfort+, Obika Leather+ and polyester and Trevira CS textiles only. The following is a quote from the report by the Danish SSI, Statens Serum Institut, "Advice and guidelines on disinfection in the health sector":

"In Denmark, ethanol at a concentration of between 70% and 85% (by volume) is recommended because it ignites more easily at higher concentrations. Ethanol vapours are less irritating to the eyes and mucous membranes and are not absorbed through the skin. Ethanol kills bacteria (e.g. tubercle bacilli), fungi and viruses (e.g. HIV, hepatitis B and C), but it has no effect on spores. Ethanol is easily inactivated by organic matter. Surfaces must therefore be cleaned prior to disinfection with ethanol." For safety reasons we recommend that instructions for use are made for the specific area of use.
